ANSWER KEY & EXPLANATORY SOLUTIONS

VERIFIED SOLUTIONS

A1 **Karate is a tool or platform that** Mitigation

Karate is a tool or platform that automates or simplifies a specific concern in the Testing domain, reducing manual effort and operational complexity for engineering teams.

A2 **Karate has key building blocks that work** Primitives

Karate has key building blocks that work together: a configuration layer defines intent, a runtime layer enforces it, and an API or CLI layer allows operators to manage and observe the system.

A3 **Karate trades off simplicity against feature richness** Hardening

Karate trades off simplicity against feature richness differently than its alternatives. Choose Karate when its specific strengths performance, ecosystem, or ease of use align with your team's primary constraints.

A4 **Install Karate via its package manager or** Gotchas

Install Karate via its package manager or binary release. Follow the quickstart to initialize a project, configure the minimal required settings, and run the default command to verify the setup works end-to-end.

A5 **Production-critical settings typically include concurrency** Integration

Production-critical settings typically include concurrency limits, timeout values, retry policies, resource limits, and logging levels. Review the official production hardening guide before deploying.

A6 **Karate provides HA through leader election, replication,** Observability

Karate provides HA through leader election, replication, or stateless horizontal scaling. Deploy at least two instances across availability zones and configure health checks for automatic failover.

A7 **Karate exposes metrics (Prometheus endpoint or built-in** Automation

Karate exposes metrics (Prometheus endpoint or built-in dashboard), structured logs, and optionally distributed traces. Define SLOs on the key metrics and alert before users are affected.

A8 **Performance bottlenecks typically stem from misconfigured** Governance

Performance bottlenecks typically stem from misconfigured connection pools, large payload sizes, insufficient worker threads, or missing caches. Profile with built-in diagnostics before optimizing.

A9 **Run Karate with the principle of least** Assessment

Run Karate with the principle of least privilege, enable TLS for all communication, use a secrets manager for credentials, and keep the software patched to the latest stable release.

A10 **Common pitfalls include skipping the documentation and** Containerization

Common pitfalls include skipping the documentation and learning the API by trial and error, using default configurations in production, lacking a runbook for operational issues, and not testing failover scenarios.
