VERIFIED SOLUTIONS

A1 Redis is a tool or platform

Mitigation

Redis is a tool or platform that automates or simplifies a specific concern in the Caching domain, reducing manual effort and operational complexity for engineering teams.

A2 Redis has key building blocks that

Primitives

Redis has key building blocks that work together: a configuration layer defines intent, a runtime layer enforces it, and an API or CLI layer allows operators to manage and observe the system.

A3 Redis trades off simplicity against feature

Hardening

Redis trades off simplicity against feature richness differently than its alternatives. Choose Redis when its specific strengths performance, ecosystem, or ease of use align with your team's primary constraints.

A4 Install Redis via its package manager

Gotchas

Install Redis via its package manager or binary release. Follow the quickstart to initialize a project, configure the minimal required settings, and run the default command to verify the setup works end-to-end.

A5 Production-critical settings typically include

Federation

Production-critical settings typically include concurrency limits, timeout values, retry policies, resource limits, and logging levels. Review the official production hardening guide before deploying.

A6 Redis provides HA through leader election,

Observability

Redis provides HA through leader election, replication, or stateless horizontal scaling. Deploy at least two instances across availability zones and configure health checks for automatic failover.

A7 Redis exposes metrics (Prometheus endpoint or

Automation

Redis exposes metrics (Prometheus endpoint or built-in dashboard), structured logs, and optionally distributed traces. Define SLOs on the key metrics and alert before users are affected.

A8 Performance bottlenecks typically stem from

Governance

Performance bottlenecks typically stem from misconfigured connection pools, large payload sizes, insufficient worker threads, or missing caches. Profile with built-in diagnostics before optimizing.

A9 Run Redis with the principle of

Assessment

Run Redis with the principle of least privilege, enable TLS for all communication, use a secrets manager for credentials, and keep the software patched to the latest stable release.

A10 Common pitfalls include skipping the

Optimization

Common pitfalls include skipping the documentation and learning the API by trial and error, using default configurations in production, lacking a runbook for operational issues, and not testing failover scenarios.
