CAFFEINE PRACTICE SHEET - 10 CONCEPTUAL Q&A

10 conceptual Q&A Caching

TOTAL: 10 QUESTIONS

Q1 What is Caffeine and what problem in Caching does it solve? *Threat Model*

Q2 What are the core components or concepts in Caffeine? *Architecture*

Q3 How does Caffeine compare to its main alternatives? *Configuration*

Q4 How do you get started with Caffeine for a new project? *Hardening*

Q5 What configuration options most affect Caffeine's behavior in production? *SSO / IdP*

Q6 How does Caffeine handle reliability and high availability? *Observability*

Q7 What observability does Caffeine provide out of the box? *Lifecycle*

Q8 What are common performance bottlenecks in Caffeine? *Compliance*

Q9 What security best practices apply when running Caffeine? *Testing*

Q10 What mistakes do teams commonly make when adopting Caffeine? *Tuning*

ANSWER KEY & EXPLANATORY SOLUTIONS

Comprehensive verified answers, best-practice configs, security controls & reference

VERIFIED SOLUTIONS

A1 Caffeine is a tool or platform that

Mitigation

Caffeine is a tool or platform that automates or simplifies a specific concern in the Caching domain, reducing manual effort and operational complexity for engineering teams.

A2 Caffeine has key building blocks that work

Primitives

Caffeine has key building blocks that work together: a configuration layer defines intent, a runtime layer enforces it, and an API or CLI layer allows operators to manage and observe the system.

A3 Caffeine trades off simplicity against feature richness

Hardening

Caffeine trades off simplicity against feature richness differently than its alternatives. Choose Caffeine when its specific strengths performance, ecosystem, or ease of use align with your team's primary constraints.

A4 Install Caffeine via its package manager or

Gotchas

Install Caffeine via its package manager or binary release. Follow the quickstart to initialize a project, configure the minimal required settings, and run the default command to verify the setup works end-to-end.

A5 Production-critical settings typically include concurrency

Federation

Production-critical settings typically include concurrency limits, timeout values, retry policies, resource limits, and logging levels. Review the official production hardening guide before deploying.

A6 Caffeine provides HA through leader election, replication,

Observability

Caffeine provides HA through leader election, replication, or stateless horizontal scaling. Deploy at least two instances across availability zones and configure health checks for automatic failover.

A7 Caffeine exposes metrics (Prometheus endpoint or built-in

Automation

Caffeine exposes metrics (Prometheus endpoint or built-in dashboard), structured logs, and optionally distributed traces. Define SLOs on the key metrics and alert before users are affected.

A8 Performance bottlenecks typically stem from misconfigured

Governance

Performance bottlenecks typically stem from misconfigured connection pools, large payload sizes, insufficient worker threads, or missing caches. Profile with built-in diagnostics before optimizing.

A9 Run Caffeine with the principle of least

Assessment

Run Caffeine with the principle of least privilege, enable TLS for all communication, use a secrets manager for credentials, and keep the software patched to the latest stable release.

A10 Common pitfalls include skipping the documentation and

Optimization

Common pitfalls include skipping the documentation and learning the API by trial and error, using default configurations in production, lacking a runbook for operational issues, and not testing failover scenarios.
