BACKEND FOR FRONTEND PRACTICE SHEET - 10 CONCEPTUAL Q&A

10 conceptual Q&A Architecture

TOTAL: 10 QUESTIONS

Q1 What is Backend for Frontend and what problem in Architecture does it solve? *Threat Model*

Q2 What are the core components or concepts in Backend for Frontend? *Architecture*

Q3 How does Backend for Frontend compare to its main alternatives? *Configuration*

Q4 How do you get started with Backend for Frontend for a new project? *Hardening*

Q5 What configuration options most affect Backend for Frontend's behavior in production? *SSO / IdP*

Q6 How does Backend for Frontend handle reliability and high availability? *Observability*

Q7 What observability does Backend for Frontend provide out of the box? *Lifecycle*

Q8 What are common performance bottlenecks in Backend for Frontend? *Compliance*

Q9 What security best practices apply when running Backend for Frontend? *Testing*

Q10 What mistakes do teams commonly make when adopting Backend for Frontend? *Tuning*

ANSWER KEY & EXPLANATORY SOLUTIONS

Comprehensive verified answers, best-practice configs, security controls & reference

VERIFIED SOLUTIONS

A1 Backend for Frontend is a tool

Mitigation

Backend for Frontend is a tool or platform that automates or simplifies a specific concern in the Architecture domain, reducing manual effort and operational complexity for engineering teams.

A2 Backend for Frontend has key building

Primitives

Backend for Frontend has key building blocks that work together: a configuration layer defines intent, a runtime layer enforces it, and an API or CLI layer allows operators to manage and observe the system.

A3 Backend for Frontend trades off simplicity

Hardening

Backend for Frontend trades off simplicity against feature richness differently than its alternatives. Choose Backend for Frontend when its specific strengths performance, ecosystem, or ease of use align with your team's primary constraints.

A4 Install Backend for Frontend via its

Gotchas

Install Backend for Frontend via its package manager or binary release. Follow the quickstart to initialize a project, configure the minimal required settings, and run the default command to verify the setup works end-to-end.

A5 Production-critical settings typically include

Federation

Production-critical settings typically include concurrency limits, timeout values, retry policies, resource limits, and logging levels. Review the official production hardening guide before deploying.

A6 Backend for Frontend provides HA through

Observability

Backend for Frontend provides HA through leader election, replication, or stateless horizontal scaling. Deploy at least two instances across availability zones and configure health checks for automatic failover.

A7 Backend for Frontend exposes metrics

Automation

Backend for Frontend exposes metrics (Prometheus endpoint or built-in dashboard), structured logs, and optionally distributed traces. Define SLOs on the key metrics and alert before users are affected.

A8 Performance bottlenecks typically stem from

Governance

Performance bottlenecks typically stem from misconfigured connection pools, large payload sizes, insufficient worker threads, or missing caches. Profile with built-in diagnostics before optimizing.

A9 Run Backend for Frontend with the

Assessment

Run Backend for Frontend with the principle of least privilege, enable TLS for all communication, use a secrets manager for credentials, and keep the software patched to the latest stable release.

A10 Common pitfalls include skipping the

Optimization

Common pitfalls include skipping the documentation and learning the API by trial and error, using default configurations in production, lacking a runbook for operational issues, and not testing failover scenarios.
