CENTOS STREAM PRACTICE SHEET - 10 CONCEPTUAL Q&A

10 conceptual Q&A Operating Systems

TOTAL: 10 QUESTIONS

Q1 What is CentOS Stream and what problem in Operating Systems does it solve? Threat Model

Q2 What are the core components or concepts in CentOS Stream? Architecture

Q3 How does CentOS Stream compare to its main alternatives? Configuration

Q4 How do you get started with CentOS Stream for a new project? Hardening

Q5 What configuration options most affect CentOS Stream's behavior in production? SSO / IdP

Q6 How does CentOS Stream handle reliability and high availability? Observability

Q7 What observability does CentOS Stream provide out of the box? Lifecycle

Q8 What are common performance bottlenecks in CentOS Stream? Compliance

Q9 What security best practices apply when running CentOS Stream? Testing

Q10 What mistakes do teams commonly make when adopting CentOS Stream? Tuning

ANSWER KEY & EXPLANATORY SOLUTIONS

Comprehensive verified answers, best-practice configs, security controls & reference

VERIFIED SOLUTIONS

A1 CentOS Stream is a tool or platform

Mitigation

CentOS Stream is a tool or platform that automates or simplifies a specific concern in the Operating Systems domain, reducing manual effort and operational complexity for engineering teams.

A2 CentOS Stream has key building blocks that

Primitives

CentOS Stream has key building blocks that work together: a configuration layer defines intent, a runtime layer enforces it, and an API or CLI layer allows operators to manage and observe the system.

A3 CentOS Stream trades off simplicity against feature

Hardening

CentOS Stream trades off simplicity against feature richness differently than its alternatives. Choose CentOS Stream when its specific strengths performance, ecosystem, or ease of use align with your team's primary constraints.

A4 Install CentOS Stream via its package manager

Gotchas

Install CentOS Stream via its package manager or binary release. Follow the quickstart to initialize a project, configure the minimal required settings, and run the default command to verify the setup works end-to-end.

A5 Production-critical settings typically include concurrency

Federation

Production-critical settings typically include concurrency limits, timeout values, retry policies, resource limits, and logging levels. Review the official production hardening guide before deploying.

A6 CentOS Stream provides HA through leader election,

Observability

CentOS Stream provides HA through leader election, replication, or stateless horizontal scaling. Deploy at least two instances across availability zones and configure health checks for automatic failover.

A7 CentOS Stream exposes metrics (Prometheus endpoint or

Automation

CentOS Stream exposes metrics (Prometheus endpoint or built-in dashboard), structured logs, and optionally distributed traces. Define SLOs on the key metrics and alert before users are affected.

A8 Performance bottlenecks typically stem from misconfigured

Performance

Performance bottlenecks typically stem from misconfigured connection pools, large payload sizes, insufficient worker threads, or missing caches. Profile with built-in diagnostics before optimizing.

A9 Run CentOS Stream with the principle of

Assessment

Run CentOS Stream with the principle of least privilege, enable TLS for all communication, use a secrets manager for credentials, and keep the software patched to the latest stable release.

A10 Common pitfalls include skipping the documentation and

Optimization

Common pitfalls include skipping the documentation and learning the API by trial and error, using default configurations in production, lacking a runbook for operational issues, and not testing failover scenarios.
