NEW RELIC PRACTICE SHEET - 10 CONCEPTUAL Q&A

10 conceptual Q&A Observability

TOTAL: 10 QUESTIONS

Q1 What is New Relic and what problem in Observability does it solve?

Threat Model

Q6 How does New Relic handle reliability and high availability?

Observability

Q2 What are the core components or concepts in New Relic?

Architecture

Q7 What observability does New Relic provide out of the box?

Lifecycle

Q3 How does New Relic compare to its main alternatives?

Configuration

Q8 What are common performance bottlenecks in New Relic?

Compliance

Q4 How do you get started with New Relic for a new project?

Hardening

Q9 What security best practices apply when running New Relic?

Testing

Q5 What configuration options most affect New Relic's behavior in production?

SSO / IdP

Q10 What mistakes do teams commonly make when adopting New Relic?

Tuning

ANSWER KEY & EXPLANATORY SOLUTIONS

Comprehensive verified answers, best-practice configs, security controls & reference

VERIFIED SOLUTIONS

A1 New Relic is a tool or

Mitigation

New Relic is a tool or platform that automates or simplifies a specific concern in the Observability domain, reducing manual effort and operational complexity for engineering teams.

A6 New Relic provides HA through leader

Observability

New Relic provides HA through leader election, replication, or stateless horizontal scaling. Deploy at least two instances across availability zones and configure health checks for automatic failover.

A2 New Relic has key building blocks

Primitives

New Relic has key building blocks that work together: a configuration layer defines intent, a runtime layer enforces it, and an API or CLI layer allows operators to manage and observe the system.

A7 New Relic exposes metrics (Prometheus)

Automation

New Relic exposes metrics (Prometheus endpoint or built-in dashboard), structured logs, and optionally distributed traces. Define SLOs on the key metrics and alert before users are affected.

A3 New Relic trades off simplicity against

Hardening

New Relic trades off simplicity against feature richness differently than its alternatives. Choose New Relic when its specific strengths performance, ecosystem, or ease of use align with your team's primary constraints.

A8 Performance bottlenecks typically stem from

Governance

Performance bottlenecks typically stem from misconfigured connection pools, large payload sizes, insufficient worker threads, or missing caches. Profile with built-in diagnostics before optimizing.

A4 Install New Relic via its package

Gotchas

Install New Relic via its package manager or binary release. Follow the quickstart to initialize a project, configure the minimal required settings, and run the default command to verify the setup works end-to-end.

A9 Run New Relic with the principle

Assessment

Run New Relic with the principle of least privilege, enable TLS for all communication, use a secrets manager for credentials, and keep the software patched to the latest stable release.

A5 Production-critical settings typically include

Federation

Production-critical settings typically include concurrency limits, timeout values, retry policies, resource limits, and logging levels. Review the official production hardening guide before deploying.

A10 Common pitfalls include skipping the

Optimization

Common pitfalls include skipping the documentation and learning the API by trial and error, using default configurations in production, lacking a runbook for operational issues, and not testing failover scenarios.
