ACTIVE DIRECTORY PRACTICE SHEET - 10 CONCEPTUAL Q&A

10 conceptual Q&A Security

TOTAL: 10 QUESTIONS

Q1 What is Active Directory and what security threat does it address? **What Model**

Q6 How do you audit and monitor Active Directory events? **Resiliability**

Q2 What is the core mechanism Active Directory uses to provide security? **provide**

Q7 How does Active Directory handle key or credential rotation? **cycle**

Q3 How do you configure Active Directory for a production application? **production web**

Q8 How does Active Directory help meet compliance requirements? **Compliance**

Q4 What are the most common Active Directory misconfigurations to avoid? **configurations**

Q9 How do you test your Active Directory configuration for weaknesses? **Testing**

Q5 How does Active Directory integrate with identity providers? **IdP**

Q10 What are the performance implications of Active Directory and how do you minimize them? **and**

ANSWER KEY & EXPLANATORY SOLUTIONS

Comprehensive verified answers, best-practice configs, security controls & reference

VERIFIED SOLUTIONS

A1 Active Directory is a security tool, protocol,

Mitigation

Active Directory is a security tool, protocol, or service that mitigates a specific class of threats: authentication bypass, data exfiltration, network intrusion, or credential theft. Understanding the threat model is prerequisite to correct configuration.

A6 Enable Active Directory's audit log and stream

Observability

Enable Active Directory's audit log and stream it to a SIEM (Splunk, Elastic SIEM). Define alert rules for high-severity events: repeated failed logins, privilege escalation, and unusual access patterns. Review logs regularly.

A2 Active Directory uses one or more security

Primitives

Active Directory uses one or more security primitives: asymmetric cryptography, symmetric encryption, certificate chains, role-based access control, or anomaly detection. These primitives are combined to provide the claimed security properties.

A7 Automate rotation using a secrets manager that

Automation

Automate rotation using a secrets manager that generates new credentials and updates consumers transparently. Test rotation in staging. Have a break-glass procedure for emergency rotation when a credential is compromised.

A3 Production configuration requires strong cipher suites,

Hardening

Production configuration requires strong cipher suites, certificate rotation, revocation checking, and minimal permission grants. Use a well-reviewed configuration reference (CIS Benchmark, OWASP) rather than default settings.

A8 Active Directory generates audit trails, enforces access,

Governance

Active Directory generates audit trails, enforces access policies, and provides encryption that satisfy controls required by SOC 2, PCI-DSS, HIPAA, and GDPR. Map Active Directory's capabilities to the specific framework controls in your compliance program.

A4 Common mistakes include using outdated algorithms (MD5),

Hardening

Common mistakes include using outdated algorithms (MD5, SHA1, RC4), leaving default credentials, ignoring certificate expiry, granting excessive permissions, and not testing the config before going live in production.

A9 Run an automated scanner (SSL Labs for

Assessment

Run an automated scanner (SSL Labs for TLS, ScoutSuite for cloud IAM, OWASP ZAP for web app auth) against your Active Directory config. Conduct penetration tests annually and after significant config changes.

A5 Active Directory delegates identity verification to an

Federation

Active Directory delegates identity verification to an IdP via SAML, OIDC, or LDAP. Users authenticate once (SSO) and receive a token that Active Directory validates. This centralizes user management and avoids duplicating auth logic across services.

A10 Cryptographic operations, token validation, and authorization

Authorization

Cryptographic operations, token validation, and authorization checks add latency. Mitigate with session caching, hardware-accelerated TLS (AES-NI), connection reuse, and async authorization where possible.
