VERIFIED SOLUTIONS

A1 Apache Hudi is a tool or platform

Mitigation

Apache Hudi is a tool or platform that automates or simplifies a specific concern in the Data Platforms domain, reducing manual effort and operational complexity for engineering teams.

A6 Apache Hudi provides HA through leader election,

Observability

Apache Hudi provides HA through leader election, replication, or stateless horizontal scaling. Deploy at least two instances across availability zones and configure health checks for automatic failover.

A2 Apache Hudi has key building blocks that

Primitives

Apache Hudi has key building blocks that work together: a configuration layer defines intent, a runtime layer enforces it, and an API or CLI layer allows operators to manage and observe the system.

A7 Apache Hudi exposes metrics (Prometheus endpoint or built-in dashboard),

Automation

Apache Hudi exposes metrics (Prometheus endpoint or built-in dashboard), structured logs, and optionally distributed traces. Define SLOs on the key metrics and alert before users are affected.

A3 Apache Hudi trades off simplicity against feature

Hardening

Apache Hudi trades off simplicity against feature richness differently than its alternatives. Choose Apache Hudi when its specific strengths performance, ecosystem, or ease of use align with your team's primary constraints.

A8 Performance bottlenecks typically stem from misconfigured

Performance

Performance bottlenecks typically stem from misconfigured connection pools, large payload sizes, insufficient worker threads, or missing caches. Profile with built-in diagnostics before optimizing.

A4 Install Apache Hudi via its package manager

Gotchas

Install Apache Hudi via its package manager or binary release. Follow the quickstart to initialize a project, configure the minimal required settings, and run the default command to verify the setup works end-to-end.

A9 Run Apache Hudi with the principle of

Assessment

Run Apache Hudi with the principle of least privilege, enable TLS for all communication, use a secrets manager for credentials, and keep the software patched to the latest stable release.

A5 Production-critical settings typically include concurrency

Concurrency

Production-critical settings typically include concurrency limits, timeout values, retry policies, resource limits, and logging levels. Review the official production hardening guide before deploying.

A10 Common pitfalls include skipping the documentation and

Documentation

Common pitfalls include skipping the documentation and learning the API by trial and error, using default configurations in production, lacking a runbook for operational issues, and not testing failover scenarios.
