AZURE OPENAI PRACTICE SHEET - 10 CONCEPTUAL Q&A

10 conceptual Q&A Cloud

TOTAL: 10 QUESTIONS

Q1 What is Azure OpenAI and what is its primary purpose in its cloud ecosystem? Security

Q6 How do you manage configuration and secrets for Azure OpenAI? Availability

Q2 How does IAM work with Azure OpenAI? Architecture

Q7 What are the main cost drivers for Azure OpenAI and how do you optimize them? Cost

Q3 How do you monitor Azure OpenAI in production? Configuration

Q8 How do you implement high availability with Azure OpenAI? Performance

Q4 How do you scale Azure OpenAI to handle variable load? Hardening

Q9 How does Azure OpenAI integrate with a CI/CD pipeline? Testing

Q5 How do you secure Azure OpenAI in production? SSO / IdP

Q10 What are common pitfalls when first adopting Azure OpenAI? Logging

ANSWER KEY & EXPLANATORY SOLUTIONS

Comprehensive verified answers, best-practice configs, security controls & reference

VERIFIED SOLUTIONS

A1 Azure OpenAI is a managed cloud service

Mitigation

Azure OpenAI is a managed cloud service that handles a specific infrastructure concern (compute, storage, messaging, AI). Using it shifts operational burden to the cloud provider while you focus on application logic.

A6 Store sensitive values in a managed secret

Observability

Store sensitive values in a managed secret store (AWS Secrets Manager, GCP Secret Manager, Azure Key Vault). Inject secrets as environment variables at runtime, never bake them into container images or source code.

A2 Access to Azure OpenAI is controlled via

Primitives

Access to Azure OpenAI is controlled via IAM roles and policies. Attach the minimum required permissions to a service account or role. Avoid long-lived access keys; use instance roles or Workload Identity Federation instead.

A7 Cost in Azure OpenAI typically comes from

Automation

Cost in Azure OpenAI typically comes from compute hours, data transfer, storage, and request counts. Right-size instances, use reserved capacity for steady-state workloads, and enable lifecycle policies to expire old data.

A3 Azure OpenAI emits metrics to the cloud

Hardening

Azure OpenAI emits metrics to the cloud provider's monitoring service (CloudWatch, Cloud Monitoring, Azure Monitor). Set alerts on key metrics (error rate, latency, capacity). Use distributed tracing to correlate across services.

A8 Deploy Azure OpenAI across multiple availability zones

Observance

Deploy Azure OpenAI across multiple availability zones. Use managed replicas or active-active configurations. Implement health checks and automatic failover. Test resilience regularly with chaos engineering or failover drills.

A4 Azure OpenAI supports auto-scaling policies based on

Gotchas

Azure OpenAI supports auto-scaling policies based on CPU, queue depth, or custom metrics. Set minimum and maximum capacity. Horizontal scaling (more instances) is generally preferred over vertical for cloud workloads.

A9 CI/CD pipelines use the cloud CLI or

Assessment

CI/CD pipelines use the cloud CLI or SDK to deploy updates to Azure OpenAI after tests pass. Infrastructure-as-code (Terraform, CDK) defines Azure OpenAI configuration as version-controlled code deployed via the pipeline.

A5 Place Azure OpenAI in a private subnet

Federation

Place Azure OpenAI in a private subnet with no public endpoint where possible. Use VPC security groups or firewall rules to allow only required traffic. Encrypt data at rest and in transit. Rotate credentials regularly.

A10 Common mistakes include misconfigured IAM policies (too

Automation

Common mistakes include misconfigured IAM policies (too permissive), no cost alerting, deploying only in one availability zone, and missing backups. Read the service SLA carefully to understand what the cloud provider guarantees.
