ANSWER KEY & EXPLANATORY SOLUTIONS

VERIFIED SOLUTIONS

A1 Consul is a tool or platform that

Mitigation

Consul is a tool or platform that automates or simplifies a specific concern in the Distributed Systems domain, reducing manual effort and operational complexity for engineering teams.

A2 Consul has key building blocks that work

Primitives

Consul has key building blocks that work together: a configuration layer defines intent, a runtime layer enforces it, and an API or CLI layer allows operators to manage and observe the system.

A3 Consul trades off simplicity against feature richness

Hardening

Consul trades off simplicity against feature richness differently than its alternatives. Choose Consul when its specific strengths performance, ecosystem, or ease of use align with your team's primary constraints.

A4 Install Consul via its package manager or

Gotchas

Install Consul via its package manager or binary release. Follow the quickstart to initialize a project, configure the minimal required settings, and run the default command to verify the setup works end-to-end.

A5 Production-critical settings typically include concurrency

Concurrency

Production-critical settings typically include concurrency limits, timeout values, retry policies, resource limits, and logging levels. Review the official production hardening guide before deploying.

A6 Consul provides HA through leader election, replication, or stateless horizontal

Availability

scaling. Deploy at least two instances across availability zones and configure health checks for automatic failover.

A7 Consul exposes metrics (Prometheus endpoint or built-in dashboard)

Information

Consul exposes metrics (Prometheus endpoint or built-in dashboard), structured logs, and optionally distributed traces. Define SLOs on the key metrics and alert before users are affected.

A8 Performance bottlenecks typically stem from misconfigured

Performance

Performance bottlenecks typically stem from misconfigured connection pools, large payload sizes, insufficient worker threads, or missing caches. Profile with built-in diagnostics before optimizing.

A9 Run Consul with the principle of least

Assessment

Run Consul with the principle of least privilege, enable TLS for all communication, use a secrets manager for credentials, and keep the software patched to the latest stable release.

A10 Common pitfalls include skipping the documentation and

Documentation

Common pitfalls include skipping the documentation and learning the API by trial and error, using default configurations in production, lacking a runbook for operational issues, and not testing failover scenarios.
