ANSWER KEY & EXPLANATORY SOLUTIONS

VERIFIED SOLUTIONS

A1 etcd is a tool or platform that

Mitigation

etcd is a tool or platform that automates or simplifies a specific concern in the Distributed Systems domain, reducing manual effort and operational complexity for engineering teams.

A2 etcd has key building blocks that work

Primitives

etcd has key building blocks that work together: a configuration layer defines intent, a runtime layer enforces it, and an API or CLI layer allows operators to manage and observe the system.

A3 etcd trades off simplicity against feature richness

Hardening

etcd trades off simplicity against feature richness differently than its alternatives. Choose etcd when its specific strengths performance, ecosystem, or ease of use align with your team's primary constraints.

A4 Install etcd via its package manager or

Gotchas

Install etcd via its package manager or binary release. Follow the quickstart to initialize a project, configure the minimal required settings, and run the default command to verify the setup works end-to-end.

A5 Production-critical settings typically include concurrency

Concurrency

Production-critical settings typically include concurrency limits, timeout values, retry policies, resource limits, and logging levels. Review the official production hardening guide before deploying.

A6 etcd provides HA through leader election, replication, and observability

Observability

etcd provides HA through leader election, replication, or stateless horizontal scaling. Deploy at least two instances across availability zones and configure health checks for automatic failover.

A7 etcd exposes metrics (Prometheus endpoint or built-in dashboard) and automation

Automation

etcd exposes metrics (Prometheus endpoint or built-in dashboard), structured logs, and optionally distributed traces. Define SLOs on the key metrics and alert before users are affected.

A8 Performance bottlenecks typically stem from misconfigured connection

Performance

Performance bottlenecks typically stem from misconfigured connection pools, large payload sizes, insufficient worker threads, or missing caches. Profile with built-in diagnostics before optimizing.

A9 Run etcd with the principle of least

Assessment

Run etcd with the principle of least privilege, enable TLS for all communication, use a secrets manager for credentials, and keep the software patched to the latest stable release.

A10 Common pitfalls include skipping the documentation and

Documentation

Common pitfalls include skipping the documentation and learning the API by trial and error, using default configurations in production, lacking a runbook for operational issues, and not testing failover scenarios.
