EVENT HUBS PRACTICE SHEET - 10 CONCEPTUAL Q&A

10 conceptual Q&A Cloud

TOTAL: 10 QUESTIONS

Q1 What is Event Hubs and what is its primary purpose in its cloud ecosystem? **Init Model**

Q6 How do you manage configuration and secrets for Event Hubs? **Event**

Q2 How does IAM work with Event Hubs? **Architecture**

Q7 What are the main cost drivers for Event Hubs and how do you optimize them? **Deployment**

Q3 How do you monitor Event Hubs in production? **Configuration**

Q8 How do you implement high availability with Event Hubs? **Compliance**

Q4 How do you scale Event Hubs to handle variable load? **Hardening**

Q9 How does Event Hubs integrate with a CI/CD pipeline? **Testing**

Q5 How do you secure Event Hubs in production? **SSO / IdP**

Q10 What are common pitfalls when first adopting Event Hubs? **Monitoring**

ANSWER KEY & EXPLANATORY SOLUTIONS

Comprehensive verified answers, best-practice configs, security controls & reference

VERIFIED SOLUTIONS

A1 Event Hubs is a managed cloud service

Mitigation

Event Hubs is a managed cloud service that handles a specific infrastructure concern (compute, storage, messaging, AI). Using it shifts operational burden to the cloud provider while you focus on application logic.

A6 Store sensitive values in a managed secret

Observability

Store sensitive values in a managed secret store (AWS Secrets Manager, GCP Secret Manager, Azure Key Vault). Inject secrets as environment variables at runtime, never bake them into container images or source code.

A2 Access to Event Hubs is controlled via

Primitives

Access to Event Hubs is controlled via IAM roles and policies. Attach the minimum required permissions to a service account or role. Avoid long-lived access keys; use instance roles or Workload Identity Federation instead.

A7 Cost in Event Hubs typically comes from

Automation

Cost in Event Hubs typically comes from compute hours, data transfer, storage, and request counts. Right-size instances, use reserved capacity for steady-state workloads, and enable lifecycle policies to expire old data.

A3 Event Hubs emits metrics to the cloud

Hardening

Event Hubs emits metrics to the cloud provider's monitoring service (CloudWatch, Cloud Monitoring, Azure Monitor). Set alerts on key metrics (error rate, latency, capacity). Use distributed tracing to correlate across services.

A8 Deploy Event Hubs across multiple availability zones

Governance

Deploy Event Hubs across multiple availability zones. Use managed replicas or active-active configurations. Implement health checks and automatic failover. Test resilience regularly with chaos engineering or failover drills.

A4 Event Hubs supports auto-scaling policies based on

Gotchas

Event Hubs supports auto-scaling policies based on CPU, queue depth, or custom metrics. Set minimum and maximum capacity. Horizontal scaling (more instances) is generally preferred over vertical for cloud workloads.

A9 CI/CD pipelines use the cloud CLI or

Assessment

CI/CD pipelines use the cloud CLI or SDK to deploy updates to Event Hubs after tests pass. Infrastructure-as-code (Terraform, CDK) defines Event Hubs configuration as version-controlled code deployed via the pipeline.

A5 Place Event Hubs in a private subnet

Federation

Place Event Hubs in a private subnet with no public endpoint where possible. Use VPC security groups or firewall rules to allow only required traffic. Encrypt data at rest and in transit. Rotate credentials regularly.

A10 Common mistakes include misconfigured IAM policies (too

permissive)

Common mistakes include misconfigured IAM policies (too permissive), no cost alerting, deploying only in one availability zone, and missing backups. Read the service SLA carefully to understand what the cloud provider guarantees.
