ANSWER KEY & EXPLANATORY SOLUTIONS

VERIFIED SOLUTIONS

A1 Keycloak is a security tool, protocol, or

Mitigation

Keycloak is a security tool, protocol, or service that mitigates a specific class of threats authentication bypass, data exfiltration, network intrusion, or credential theft. Understanding the threat model is prerequisite to correct configuration.

A6 Enable Keycloak's audit log and stream it

Observability

Enable Keycloak's audit log and stream it to a SIEM (Splunk, Elastic SIEM). Define alert rules for high-severity events: repeated failed logins, privilege escalation, and unusual access patterns. Review logs regularly.

A2 Keycloak uses one or more security primitives:

Primitives

Keycloak uses one or more security primitives: asymmetric cryptography, symmetric encryption, certificate chains, role-based access control, or anomaly detection. These primitives are combined to provide the claimed security properties.

A7 Automate rotation using a secrets manager that

Automation

Automate rotation using a secrets manager that generates new credentials and updates consumers transparently. Test rotation in staging. Have a break-glass procedure for emergency rotation when a credential is compromised.

A3 Production configuration requires strong cipher suites

Hardening

Production configuration requires strong cipher suites, certificate rotation, revocation checking, and minimal permission grants. Use a well-reviewed configuration reference (CIS Benchmark, OWASP) rather than default settings.

A8 Keycloak generates audit trails, enforces access policies,

Compliance

Keycloak generates audit trails, enforces access policies, and provides encryption that satisfy controls required by SOC 2, PCI-DSS, HIPAA, and GDPR. Map Keycloak's capabilities to the specific framework controls in your compliance program.

A4 Common mistakes include using outdated algorithms (MD5, SHA1, RC4)

MD5 has

Common mistakes include using outdated algorithms (MD5, SHA1, RC4), leaving default credentials, ignoring certificate expiry, granting excessive permissions, and not testing the config before going live in production.

A9 Run an automated scanner (SSL Labs for TLS, ScoutSuite for cloud IAM, OWASP ZAP for web app auth)

Assessment

Run an automated scanner (SSL Labs for TLS, ScoutSuite for cloud IAM, OWASP ZAP for web app auth) against your Keycloak config. Conduct penetration tests annually and after significant config changes.

A5 Keycloak delegates identity verification to an IdP

Federation

Keycloak delegates identity verification to an IdP via SAML, OIDC, or LDAP. Users authenticate once (SSO) and receive a token that Keycloak validates. This centralizes user management and avoids duplicating auth logic across services.

A10 Cryptographic operations, token validation, and authorization

Authorization

Cryptographic operations, token validation, and authorization checks add latency. Mitigate with session caching, hardware-accelerated TLS (AES-NI), connection reuse, and async authorization where possible.
