ANSWER KEY & EXPLANATORY SOLUTIONS

VERIFIED SOLUTIONS

A1 Lit is a tool or platform that

Mitigation

Lit is a tool or platform that automates or simplifies a specific concern in the Web Technologies domain, reducing manual effort and operational complexity for engineering teams.

A6 Lit provides HA through leader election, replication, Observability

Lit provides HA through leader election, replication, or stateless horizontal scaling. Deploy at least two instances across availability zones and configure health checks for automatic failover.

A2 Lit has key building blocks that work

Primitives

Lit has key building blocks that work together: a configuration layer defines intent, a runtime layer enforces it, and an API or CLI layer allows operators to manage and observe the system.

A7 Lit exposes metrics (Prometheus endpoint or built-in Automation

Lit exposes metrics (Prometheus endpoint or built-in dashboard), structured logs, and optionally distributed traces. Define SLOs on the key metrics and alert before users are affected.

A3 Lit trades off simplicity against feature richness

Hardening

Lit trades off simplicity against feature richness differently than its alternatives. Choose Lit when its specific strengths performance, ecosystem, or ease of use align with your team's primary constraints.

A8 Performance bottlenecks typically stem from misconfigured Performance

Performance bottlenecks typically stem from misconfigured connection pools, large payload sizes, insufficient worker threads, or missing caches. Profile with built-in diagnostics before optimizing.

A4 Install Lit via its package manager or

Gotchas

Install Lit via its package manager or binary release. Follow the quickstart to initialize a project, configure the minimal required settings, and run the default command to verify the setup works end-to-end.

A9 Run Lit with the principle of least

Assessment

Run Lit with the principle of least privilege, enable TLS for all communication, use a secrets manager for credentials, and keep the software patched to the latest stable release.

A5 Production-critical settings typically include concurrency, Configuration

Configuration

Production-critical settings typically include concurrency limits, timeout values, retry policies, resource limits, and logging levels. Review the official production hardening guide before deploying.

A10 Common pitfalls include skipping the documentation and Operationalization

Operationalization

Common pitfalls include skipping the documentation and learning the API by trial and error, using default configurations in production, lacking a runbook for operational issues, and not testing failover scenarios.
