VERIFIED SOLUTIONS

A1 Service Discovery is a tool or platform

Mitigation

Service Discovery is a tool or platform that automates or simplifies a specific concern in the Microservices domain, reducing manual effort and operational complexity for engineering teams.

A6 Service Discovery provides HA through leader election, replication, or stateless

Availability

Service Discovery provides HA through leader election, replication, or stateless horizontal scaling. Deploy at least two instances across availability zones and configure health checks for automatic failover.

A2 Service Discovery has key building blocks that

Primitives

Service Discovery has key building blocks that work together: a configuration layer defines intent, a runtime layer enforces it, and an API or CLI layer allows operators to manage and observe the system.

A7 Service Discovery exposes metrics (Prometheus endpoint or built-in dashboard),

Monitoring

structured logs, and optionally distributed traces. Define SLOs on the key metrics and alert before users are affected.

A3 Service Discovery trades off simplicity against feature richness differently than its

Hardening

alternatives. Choose Service Discovery when its specific strengths performance, ecosystem, or ease of use align with your team's primary constraints.

A8 Performance bottlenecks typically stem from misconfigured connection

Performance

Performance bottlenecks typically stem from misconfigured connection pools, large payload sizes, insufficient worker threads, or missing caches. Profile with built-in diagnostics before optimizing.

A4 Install Service Discovery via its package manager

Gotchas

Install Service Discovery via its package manager or binary release. Follow the quickstart to initialize a project, configure the minimal required settings, and run the default command to verify the setup works end-to-end.

A9 Run Service Discovery with the principle of

Assessment

Run Service Discovery with the principle of least privilege, enable TLS for all communication, use a secrets manager for credentials, and keep the software patched to the latest stable release.

A5 Production-critical settings typically include concurrency limits, timeout values,

Configuration

retry policies, resource limits, and logging levels. Review the official production hardening guide before deploying.

A10 Common pitfalls include skipping the documentation and learning the API by trial

Documentation

and error, using default configurations in production, lacking a runbook for operational issues, and not testing failover scenarios.
