VERIFIED SOLUTIONS

A1 Argo Rollouts addresses a specific concern

Mitigation

Argo Rollouts addresses a specific concern provisioning, configuration management, orchestration, or CI/CD by automating manual steps that are error-prone, slow, or not reproducible when done by hand.

A6 CI/CD pipelines call Argo Rollouts in automated

Observability

CI/CD pipelines call Argo Rollouts in automated steps: plan on a pull request to preview changes and apply on merge to main. Approval gates can require a human to review the plan before changes go to production.

A2 Argo Rollouts has a control plane that

Primitives

Argo Rollouts has a control plane that stores desired state and a data plane (agents or push-based SSH) that enforces it. Understanding this distinction clarifies where configuration is evaluated and where changes are applied.

A7 Check Argo Rollouts's logs for the specific

Automation

Check Argo Rollouts's logs for the specific error message and the resource that failed. For infrastructure tools, re-run with increased verbosity (-v, --debug). Review the state file or event history to understand what changed before the failure.

A3 Argo Rollouts uses declarative files (YAML, HCL,

Hardening

Argo Rollouts uses declarative files (YAML, HCL, or a DSL) to express desired state. A plan/diff phase shows what will change before applying. Version-controlling these files enables peer review and rollback.

A8 Rotate credentials used by Argo Rollouts, restrict

Governance

Rotate credentials used by Argo Rollouts, restrict network access to its control plane, enable audit logging of all operations, and use least-privilege service accounts. Never run Argo Rollouts with admin credentials in production.

A4 Argo Rollouts operations are designed to produce

Gotchas

Argo Rollouts operations are designed to produce the same result when run multiple times. Applying the same config twice converges to the desired state rather than creating duplicate resources. This makes automation safe to re-run.

A9 Large Argo Rollouts deployments use workspaces or namespaces or

Assessment

Large Argo Rollouts deployments use workspaces or namespaces to isolate environments, remote state backends for team collaboration, and modular code to avoid a single monolithic config that is slow to plan/apply.

A5 Secrets should never be stored in plain

Federation

Secrets should never be stored in plain text in Argo Rollouts config files. Use a secrets backend (Vault, AWS Secrets Manager) and inject values at runtime via environment variables or encrypted vaults supported by the tool.

A10 Common pitfalls include storing secrets in plain

Optimization

Common pitfalls include storing secrets in plain text config, skipping the plan step before apply, not reviewing state drift, and not having a rollback strategy when a deployment fails partway through.
