CDN PRACTICE SHEET - 10 CONCEPTUAL Q&A

10 conceptual Q&A Content Management

TOTAL: 10 QUESTIONS

Q1 What is CDN and what problem in Content Management does it solve?

Q6 How does CDN handle reliability and high availability?

Q2 What are the core components or concepts in CDN?

Architecture

Q7 What observability does CDN provide out of the box?

Lifecycle

Q3 How does CDN compare to its main alternatives?

Configuration

Q8 What are common performance bottlenecks in CDN?

Compliance

Q4 How do you get started with CDN for a new project?

Hardening

Q9 What security best practices apply when running CDN?

Testing

Q5 What configuration options most affect CDN's behavior in production?

ISO / IdP

Q10 What mistakes do teams commonly make when adopting CDN?

Tuning

ANSWER KEY & EXPLANATORY SOLUTIONS

Comprehensive verified answers, best-practice configs, security controls & reference

VERIFIED SOLUTIONS

A1 CDN is a tool or platform that

Mitigation

CDN is a tool or platform that automates or simplifies a specific concern in the Content Management domain, reducing manual effort and operational complexity for engineering teams.

A2 CDN has key building blocks that work

Primitives

CDN has key building blocks that work together: a configuration layer defines intent, a runtime layer enforces it, and an API or CLI layer allows operators to manage and observe the system.

A3 CDN trades off simplicity against feature richness

Hardening

CDN trades off simplicity against feature richness differently than its alternatives. Choose CDN when its specific strengths performance, ecosystem, or ease of use align with your team's primary constraints.

A4 Install CDN via its package manager or

Gotchas

Install CDN via its package manager or binary release. Follow the quickstart to initialize a project, configure the minimal required settings, and run the default command to verify the setup works end-to-end.

A5 Production-critical settings typically include concurrency

Concurrency

Production-critical settings typically include concurrency limits, timeout values, retry policies, resource limits, and logging levels. Review the official production hardening guide before deploying.

A6 CDN provides HA through leader election, replication, and observability

Observability

CDN provides HA through leader election, replication, or stateless horizontal scaling. Deploy at least two instances across availability zones and configure health checks for automatic failover.

A7 CDN exposes metrics (Prometheus endpoint or built-in dashboard)

Automation

CDN exposes metrics (Prometheus endpoint or built-in dashboard), structured logs, and optionally distributed traces. Define SLOs on the key metrics and alert before users are affected.

A8 Performance bottlenecks typically stem from misconfiguration

Performance

Performance bottlenecks typically stem from misconfigured connection pools, large payload sizes, insufficient worker threads, or missing caches. Profile with built-in diagnostics before optimizing.

A9 Run CDN with the principle of least

Assessment

Run CDN with the principle of least privilege, enable TLS for all communication, use a secrets manager for credentials, and keep the software patched to the latest stable release.

A10 Common pitfalls include skipping the documentation and

Documentation

Common pitfalls include skipping the documentation and learning the API by trial and error, using default configurations in production, lacking a runbook for operational issues, and not testing failover scenarios.
