VERIFIED SOLUTIONS

A1 Cypress is a tool or platform that

Mitigation

Cypress is a tool or platform that automates or simplifies a specific concern in the Testing domain, reducing manual effort and operational complexity for engineering teams.

A6 Cypress provides HA through leader election, replication, or stateless horizontal

Availability

Cypress provides HA through leader election, replication, or stateless horizontal scaling. Deploy at least two instances across availability zones and configure health checks for automatic failover.

A2 Cypress has key building blocks that work

Primitives

Cypress has key building blocks that work together: a configuration layer defines intent, a runtime layer enforces it, and an API or CLI layer allows operators to manage and observe the system.

A7 Cypress exposes metrics (Prometheus endpoint or built-in dashboard), structured

Observation

Cypress exposes metrics (Prometheus endpoint or built-in dashboard), structured logs, and optionally distributed traces. Define SLOs on the key metrics and alert before users are affected.

A3 Cypress trades off simplicity against feature richness

Hardening

Cypress trades off simplicity against feature richness differently than its alternatives. Choose Cypress when its specific strengths performance, ecosystem, or ease of use align with your team's primary constraints.

A8 Performance bottlenecks typically stem from misconfigured connection

Performance

Performance bottlenecks typically stem from misconfigured connection pools, large payload sizes, insufficient worker threads, or missing caches. Profile with built-in diagnostics before optimizing.

A4 Install Cypress via its package manager or

Gotchas

Install Cypress via its package manager or binary release. Follow the quickstart to initialize a project, configure the minimal required settings, and run the default command to verify the setup works end-to-end.

A9 Run Cypress with the principle of least

Assessment

Run Cypress with the principle of least privilege, enable TLS for all communication, use a secrets manager for credentials, and keep the software patched to the latest stable release.

A5 Production-critical settings typically include concurrency limits, timeout values,

Configuration

retry policies, resource limits, and logging levels. Review the official production hardening guide before deploying.

A10 Common pitfalls include skipping the documentation and learning the API by trial

Configuration

and error, using default configurations in production, lacking a runbook for operational issues, and not testing failover scenarios.
