EVENT-DRIVEN ARCHITECTURE PRACTICE SHEET - 10 CONCEPTUAL Q&A

10 conceptual Q&A Architecture

TOTAL: 10 QUESTIONS

Q1 What is Event-Driven Architecture and what problem in **Treat Model** Architecture does it solve?

Q6 How does Event-Driven Architecture handle reliability and high availability?

Q2 What are the core components or concepts in Event-Driven Architecture?

Q7 What observability does Event-Driven Architecture provide out of the box?

Q3 How does Event-Driven Architecture compare to its main alternatives?

Q8 What are common performance bottlenecks in Event-Driven Architecture?

Q4 How do you get started with Event-Driven Architecture for a new project?

Q9 What security best practices apply when running Event-Driven Architecture?

Q5 What configuration options most affect Event-Driven Architecture's behavior in production?

Q10 What mistakes do teams commonly make when adopting Event-Driven Architecture?

ANSWER KEY & EXPLANATORY SOLUTIONS

Comprehensive verified answers, best-practice configs, security controls & reference

VERIFIED SOLUTIONS

A1 Event-Driven Architecture is a tool or platform

Mitigation

Event-Driven Architecture is a tool or platform that automates or simplifies a specific concern in the Architecture domain, reducing manual effort and operational complexity for engineering teams.

A6 Event-Driven Architecture provides HA through leader election, replication, or stateless horizontal scaling. Deploy at least two instances across availability zones and configure health checks for automatic failover.

Observability

A2 Event-Driven Architecture has key building blocks that work together: a configuration layer defines intent, a runtime layer enforces it, and an API or CLI layer allows operators to manage and observe the system.

Primitives

A7 Event-Driven Architecture exposes metrics (Prometheus endpoint or built-in dashboard), structured logs, and optionally distributed traces. Define SLOs on the key metrics and alert before users are affected.

Information

A3 Event-Driven Architecture trades off simplicity against feature richness differently than its alternatives. Choose Event-Driven Architecture when its specific strengths performance, ecosystem, or ease of use align with your team's primary constraints.

Feature

A8 Performance bottlenecks typically stem from misconfigured connection pools, large payload sizes, insufficient worker threads, or missing caches. Profile with built-in diagnostics before optimizing.

Performance

A4 Install Event-Driven Architecture via its package manager or binary release. Follow the quickstart to initialize a project, configure the minimal required settings, and run the default command to verify the setup works end-to-end.

Gotchas

A9 Run Event-Driven Architecture with the principle of least privilege, enable TLS for all communication, use a secrets manager for credentials, and keep the software patched to the latest stable release.

Assessment

A5 Production-critical settings typically include concurrency limits, timeout values, retry policies, resource limits, and logging levels. Review the official production hardening guide before deploying.

Configuration

A10 Common pitfalls include skipping the documentation and learning the API by trial and error, using default configurations in production, lacking a runbook for operational issues, and not testing failover scenarios.

Optimization
