VERIFIED SOLUTIONS

A1 Modular Monolith is a tool or platform

Mitigation

Modular Monolith is a tool or platform that automates or simplifies a specific concern in the Architecture domain, reducing manual effort and operational complexity for engineering teams.

A6 Modular Monolith provides HA through leader election, replication, or stateless

High Availability

Modular Monolith provides HA through leader election, replication, or stateless horizontal scaling. Deploy at least two instances across availability zones and configure health checks for automatic failover.

A2 Modular Monolith has key building blocks that

Primitives

Modular Monolith has key building blocks that work together: a configuration layer defines intent, a runtime layer enforces it, and an API or CLI layer allows operators to manage and observe the system.

A7 Modular Monolith exposes metrics (Prometheus endpoint or built-in dashboard), structured logs, and optionally distributed traces. Define SLOs on the key metrics and alert before users are affected.

Observability

A3 Modular Monolith trades off simplicity against feature richness differently than its alternatives. Choose Modular Monolith when its specific strengths performance, ecosystem, or ease of use align with your team's primary constraints.

Hardening

Modular Monolith trades off simplicity against feature richness differently than its alternatives. Choose Modular Monolith when its specific strengths performance, ecosystem, or ease of use align with your team's primary constraints.

A8 Performance bottlenecks typically stem from misconfigured connection pools, large payload sizes, insufficient worker threads, or missing caches. Profile with built-in diagnostics before optimizing.

Performance

A4 Install Modular Monolith via its package manager

Gotchas

Install Modular Monolith via its package manager or binary release. Follow the quickstart to initialize a project, configure the minimal required settings, and run the default command to verify the setup works end-to-end.

A9 Run Modular Monolith with the principle of least privilege, enable TLS for all communication, use a secrets manager for credentials, and keep the software patched to the latest stable release.

Assessment

Run Modular Monolith with the principle of least privilege, enable TLS for all communication, use a secrets manager for credentials, and keep the software patched to the latest stable release.

A5 Production-critical settings typically include concurrency limits, timeout values, retry policies, resource limits, and logging levels. Review the official production hardening guide before deploying.

Configuration

Production-critical settings typically include concurrency limits, timeout values, retry policies, resource limits, and logging levels. Review the official production hardening guide before deploying.

A10 Common pitfalls include skipping the documentation and learning the API by trial and error, using default configurations in production, lacking a runbook for operational issues, and not testing failover scenarios.
