OPENAI AGENTS SDK PRACTICE SHEET - 10 CONCEPTUAL Q&A

10 conceptual Q&A AI Agents

TOTAL: 10 QUESTIONS

Q1 What is OpenAI Agents SDK and what AI/ML use case is it designed for?

Q6 How do you evaluate a model's performance in OpenAI Agents SDK?

Q2 What are the core abstractions in OpenAI Agents SDK?

Q7 How do you deploy a model trained with OpenAI Agents SDK?

Q3 How does OpenAI Agents SDK handle training or inference?

Q8 How does OpenAI Agents SDK handle distributed or multi-GPU training?

Q4 How does OpenAI Agents SDK manage data preprocessing?

Q9 How do you track experiments and versions in OpenAI Agents SDK?

Q5 How does OpenAI Agents SDK support GPU/TPU acceleration?

Q10 What are common pitfalls when using OpenAI Agents SDK in production?

ANSWER KEY & EXPLANATORY SOLUTIONS

Comprehensive verified answers, best-practice configs, security controls & reference

VERIFIED SOLUTIONS

A1 OpenAI Agents SDK is a framework or

Mitigation

OpenAI Agents SDK is a framework or service targeting a specific AI/ML domain training neural networks, building LLM pipelines, deploying models, or orchestrating agents. Understanding its scope helps you know when to use it vs alternatives.

A2 OpenAI Agents SDK organizes work around abstractions

Alternatives

OpenAI Agents SDK organizes work around abstractions like models, tensors, pipelines, agents, or embeddings. Learning these core types is the first step to using the framework effectively.

A3 For training, OpenAI Agents SDK defines a

Hardening

For training, OpenAI Agents SDK defines a model architecture, a loss function, and an optimizer. For inference, a trained model processes input data and returns predictions. Batch processing and hardware acceleration are key performance levers.

A4 OpenAI Agents SDK provides data loaders, tokenizers,

Gotchas

OpenAI Agents SDK provides data loaders, tokenizers, or pipeline components that transform raw data into the tensor or embedding format the model expects. Proper preprocessing is critical for model correctness and training speed.

A5 OpenAI Agents SDK detects available accelerators and

Federation

OpenAI Agents SDK detects available accelerators and moves computation to them. Specify the device explicitly (cuda, mps, tpu) to avoid accidentally running expensive operations on CPU. Mixed-precision (fp16/bf16) further reduces memory and increases throughput.

A6 Evaluation uses a held-out validation set and

Observability

Evaluation uses a held-out validation set and metrics (accuracy, F1, BLEU, perplexity) appropriate to the task. Monitor both training and validation metrics to detect overfitting. Use a test set only at the very end to report final results.

A7 Export the model to a portable format

Automation

Export the model to a portable format (ONNX, TorchScript, SavedModel). Serve it via a model server (TorchServe, TF Serving, Triton) or embed it in an API endpoint. Monitor inference latency and drift in production.

A8 OpenAI Agents SDK provides data-parallel or model-parallel

Performance

OpenAI Agents SDK provides data-parallel or model-parallel strategies to split work across GPUs. Data parallelism replicates the model on each GPU and averages gradients. Model parallelism splits layers across devices for models too large for one GPU.

A9 Use an experiment tracker (MLflow, Weights &

Assessment

Use an experiment tracker (MLflow, Weights & Biases, Comet) alongside OpenAI Agents SDK to log hyperparameters, metrics, and artifacts. Track the code version and data version for full reproducibility.

A10 Common issues include training-serving skew (different

Optimization

Common issues include training-serving skew (different preprocessing), missing input validation, no latency SLA enforcement, models not versioned, and no process to retrain on drifted data distributions.
