## ERLANG PRACTICE SHEET - 10 CONCEPTUAL Q&A

10 conceptual Q&A Programming Languages

TOTAL: 10 QUESTIONS

**Q1** What are the primary design goals of Erlang?

Threat Model

---

---

**Q6** How does Erlang implement object-oriented or functional programming?

Observability

---

---

**Q2** How does Erlang handle type checking: static or dynamic?

Architecture

---

---

**Q7** How does Erlang handle errors?

Lifecycle

---

---

**Q3** How does Erlang manage memory?

Configuration

---

---

**Q8** What testing tools are commonly used in Erlang?

Compliance

---

---

**Q4** What is Erlang's concurrency model?

Hardening

---

---

**Q9** What makes Erlang well-suited for its target domain?

Testing

---

---

**Q5** How are packages and dependencies managed in Erlang?

SSO / IdP

---

---

**Q10** What are common performance pitfalls in Erlang?

Tuning

---

---

ANSWER KEY & EXPLANATORY SOLUTIONS

Comprehensive verified answers, best-practice configs, security controls & reference

VERIFIED SOLUTIONS

A1 Erlang was designed with specific priorities

Mitigation

Erlang was designed with specific priorities around performance, safety, or developer productivity depending on its domain. These goals shape its syntax, type system, and standard library choices.

A6 Erlang supports classes and inheritance for

Observability

Erlang supports classes and inheritance for OOP, or first-class functions and immutability for FP, or both. Many modern Erlang programs blend both paradigms depending on the problem.

A2 Erlang uses its type system to

Primitives

Erlang uses its type system to catch errors at compile time (static) or at runtime (dynamic). This affects refactoring safety, tooling support, and the kinds of bugs that reach production.

A7 Erlang surfaces errors via exceptions,

Automation

Erlang surfaces errors via exceptions, Result/Either types, or error return values. The choice impacts whether errors are checked at compile time and how calling code is structured.

A3 Erlang uses one of three approaches:

Hardening

Erlang uses one of three approaches: manual allocation/deallocation, a garbage collector that periodically reclaims unreachable objects, or automatic reference counting. Each has different latency and throughput tradeoffs.

A8 Erlang has a standard or widely

Governance

Erlang has a standard or widely adopted test runner and assertion library. Tests are typically organized into unit, integration, and end-to-end layers with coverage reporting built in or via plugins.

A4 Erlang supports concurrency through threads,

Gotchas

Erlang supports concurrency through threads, coroutines, async/await, or an actor model. The choice determines how I/O-bound and CPU-bound workloads are scaled and how shared state is safely accessed.

A9 Erlang excels in its domain due

Assessment

Erlang excels in its domain due to a combination of performance characteristics, ecosystem maturity, language ergonomics, and community support that makes common tasks simple.

A5 Erlang uses a package manager and

Federation

Erlang uses a package manager and a manifest file to declare dependencies and version constraints. A lock file pins exact versions to ensure reproducible builds across environments.

A10 Typical performance issues in Erlang include

Optimization

Typical performance issues in Erlang include excessive allocations, blocking the main thread or event loop,  $O(n^2)$  data structures, and missing caching. Profiling and benchmarking tools are available to diagnose them.
